

Liquidity for any asset.

A peer-to-peer market on Solana that turns idle NFTs and tokens into provably-fair, real-time prize machines.

■ THE GAP

Every wallet is full of assets that can't be priced or sold.

Long-tail NFTs and tokens sit idle, with no bid, no yield, no exit at floor. Yet mystery packs are a proven demand engine. FWA proved the onchain version on Ethereum: viral in ~10 days, thousands of ETH. What's missing on Solana is the liquidity primitive for any asset.

Any asset

THE MISSING PRIMITIVE

■ THE PRIMITIVE

Liquidity for **any asset.**

An owner posts an asset plus a pre-funded buyback price. Buyers pull for a provably-fair chance to win it. The draw is just the interface. Every pull is a real willingness-to-pay signal, making Gabox a price-discovery market for assets nobody can cleanly price.

FOR OWNERS

Your dead asset now quotes a price and earns a fee while it waits.

FOR BUYERS

Everything is collateralized before it can be won.

FOR SOLANA

A native price and exit layer for illiquid assets.

■ THE BALLAST

One number is the price, the odds, and the yield.

The **ballast** is the capital an owner posts behind an asset. Draw weight = $1 / \text{ballast}$. Heavily backed assets sink deep and surface rarely (grails); lightly backed ones sit shallow and get pulled often (commons). Value, rarity, and odds are one axis.

Every buyback is pre-funded, with no protocol vault, no risk of ruin. **Solvency is the headline.** The owner earns a share of every pull.

■ TRUST, ONCHAIN

Every pull is provably fair. Natively.

Fairness isn't a promise, it's onchain. Every pull settles with **MagicBlock VRF**: provably random, without replacement, exact odds, checkable by anyone and riggable by no one.

STEP 01

Pull

Buyer commits collateral.

STEP 02 · MAGICBLOCK

VRF

Provable randomness, exact odds.

STEP 03

Verifiable result

Anyone can check the draw.

■ CONSUMER, NOT DEFI

A consumer app, at consumer speed.

Gabox is a high-frequency consumer app: thousands of fast, low-value pulls, live depth, and instant buybacks on win. It has to feel like opening a pack: instant, gasless, real-time. That performance profile is the product.

Gasless

UX

Live

DEPTH

YIELD & VELOCITY

The same asset earns,
again and again.

A pack is priced modestly above pool value. ~90% of the spread streams to depositors as yield; the protocol keeps ~2% plus a growing USDC float. Since ~99% of winners take cash, the same escrowed asset recycles and earns every loop.

\$50

PROTOCOL

~99%

CASHBACK

Illustrative, on a \$40-
value pool

1

Deposit backs the pool →

2

Buyer pulls the pack →

3

Winner takes cash (~99%) →

4

Asset recycles & earns again

The one metric we watch: **cashback rate** (asset velocity).

Illustrative economics, informational only. Not investment advice or an offer of securities.

Give every asset a price.

The price and exit layer for illiquid Solana assets starts with the pull.
